

**ABSTRACT OF THE DISCLOSURE**

The present invention relates to IL-13 vaccines and their use in the treatment of diseases that are treatable with neutralization of IL-13 such as COPD, asthma and atopic disorders such as hayfever, contact allergies and atopic dermatitis. The vaccines of the present invention comprise an IL-13 immunogen and an adjuvant composition which is a combination of saponin and an immunostimulatory oligonucleotide comprising at least one unmethylated dinucleotide. The invention further relates to pharmaceutical compositions comprising such immunogens and their use in medicine and to methods for their protection.
